## Docker & Containers for Science

Joe Zuntz

#### Overview

#### **Talk**

- Motivations
- Containers
- Docker & Dockerfiles
- Data storage
- Scientific Usage
- Case Study
- HPC
- Image Management

#### **Tutorial**

- Installing
- Running a container
- Dockerfiles
- Lifetimes
- Data
- Jupyter
- Advanced Dockerfiles
- Docker Hub
- Exploring Images

#### Motivations

- Portable & repeatable environments
- Easy installation of complete software stacks
- Virtual machines too heavy
- Easy mass deployment
- Application isolation

#### Containers

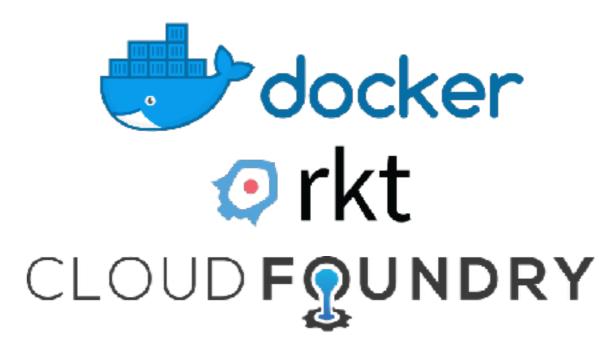

- An approach to solving these problems
  - with bundled up file systems
  - and isolated processes

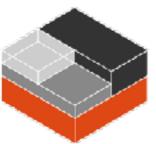

#### Ways to think of containers

- Packaged up file system
- Lightweight virtual machine
- Application with bundled dependencies
- Sandboxed system

#### Container Frameworks

- Docker
- CoreOS rkt
- Garden (Cloud Foundry)
- LXD

- Ecosystem complicated!
- Make crowding but significant interoperability

- Market-leading container framework
- Open source framework and open container format
  - Images easily exported to other frameworks
- Well documented and supported

- Mac: <a href="https://store.docker.com/editions/community/docker-ce-desktop-mac">https://store.docker.com/editions/community/docker-ce-desktop-mac</a>
- Windows: <a href="https://store.docker.com/editions/community/docker-ce-desktop-windows">https://store.docker.com/editions/community/docker-ce-desktop-windows</a>
- Linux: <a href="https://docs.docker.com/engine/installation/">https://docs.docker.com/engine/installation/</a>
  - Go to "Server" and find your OS.
  - Select "CE" (community edition) if it gives you two choices
  - May also be in your package manager (yum/apt)
- docker pull ubuntu

### Glossary

Term	Meaning
Docker	Framework for building and sharing images and running containers
Image	Frozen snapshot of a file system
Container	Instance of an image with processes running in it
Dockerfile	Recipe for making images
DockerHub	Shared repository of images

## Compared to Virtual Machines

- Dramatically faster startup
  - Can package single command as container start
- Much lighter
- Less isolated from host machine

Program	Program	Program			
File system	File system	File system			
Guest OS	Guest OS	Guest OS			
Kernel	Kernel	Kernel			
Hypervisor (VM Manager)					
Host OS					
Host Kernel					
Hardware					

Program	Program	Program		
File system	File system			
Host OS	Host OS			
Docker Engine				
Host OS				
Host Kernel				
Hardware				

**Virtual Machine** 

Docker (under Linux)

#### Mac & Windows

- Docker "really" only runs under Linux
- On Mac & Windows tiny linux layer run as VM
- No CPU performance impact
- Sometimes disk I/O impact

 Issues with permissions means it actually works better on a mac than linux

#### Tutorial 2: Running

- docker run --rm -it ubuntu bash
- Run some commands and explore the system, create some files, download some packages, etc.
- In another tab: docker ps
- exit when complete
- docker images

#### Tutorial 2: Running

docker run --rm -it ubuntu bash

- --rm means the container is deleted after the command stops
  - Data you create in the container is deleted with rm.
  - Otherwise have to delete manually later
  - Alternative: use a single long-running container
- -i and -t make the container properly interactive

#### Dockerfiles

- Recipe for building images
- Sequence of commands
- Steps cached so quick to modify
- Usually start from existing image
- Will discuss in detail during tutorial

```
ubuntu: 16.10
MAINTAINER joezuntz@googlemail.com
#Joe's note to himself. Compile this with: docker build -t joezuntz/cosmosis-base
#then docker push joezuntz/cosmosis-base
# Basic compilers and tools dependencies
   apt-get update -y && apt-get install -y gcc g++ gfortran wget make python-dev \
   pkq-confiq curl \
   && apt-get clean all
# Manual installation of mpich seems to be required to work on NERSC
   mkdir /opt/mpich && cd /opt/mpich \
   && wget http://www.mpich.org/static/downloads/3.2/mpich-3.2.tar.gz \
   && tar xvzf mpich-3.2.tar.gz && cd mpich-3.2 && ./configure && make -j4 \
   && make install && rm -rf /opt/mpich
 The environment variables needed by the CosmoSIS build and runtime.
   GSL INC /usr/include
   GSL LIB /usr/lib/x86 64-linux-qnu
   CFITSIO INC /usr/include
   CFITSIO_LIB /usr/lib/x86_64-linux-qnu
   FFTW_LIBRARY /usr/lib/x86_64-linux-gnu
   FFTW_INC_DIR /usr/include
   MINUIT2_LIB /usr/local/lib
   MINUIT2_INC /usr/local/include
# Run a bash login shell if no other command is specified.
   ["/bin/bash", "-l"]
```

#### **Tutorial 3: Dockerfiles**

Create an empty directory and a file in it called Dockerfile:

```
FROM ubuntu:latest

LABEL maintainer="your_email@example.com"

RUN apt-get update && apt-get install -y python3 python3-pip
```

From that directory run

```
docker build -t my-image .
```

## Tutorial 3: Dockerfiles

Add these line to end of your Dockerfile:

```
RUN pip3 install jupyter ipython numpy
```

Build again:

```
docker build -t my-image .
```

Run a container:

```
docker run -it --rm my-jupyter ipython
```

## Tutorial 3: Dockerfiles

- Lines executed sequentially
- Each line creates a new layer in file system
- -t identifies image with tag

#### Docker for Scientists

- We mostly run programs not services
- Environments can be fiddly and custom
- More likely to be CPU and disk limited than network
- Our users are often developers too
- Use clusters and supercomputers in locked-down environments

#### Docker Target Market

- Web servers and related components
- Enterprise services
- Long-running processes like databases
- Cloud computing

Not aimed at scientists =>
 Weird behaviour & docs

#### Tutorial 4: Lifetimes

- docker run -it ubuntu bash
- Create some large files and then exit e.g. cat > my.txt
- docker ps -as
- Container is stopped but not removed:
- docker start -i container number
- Can only re-run the same command you started with
- Task: Figure out how to use the **docker rm** command to remove your container

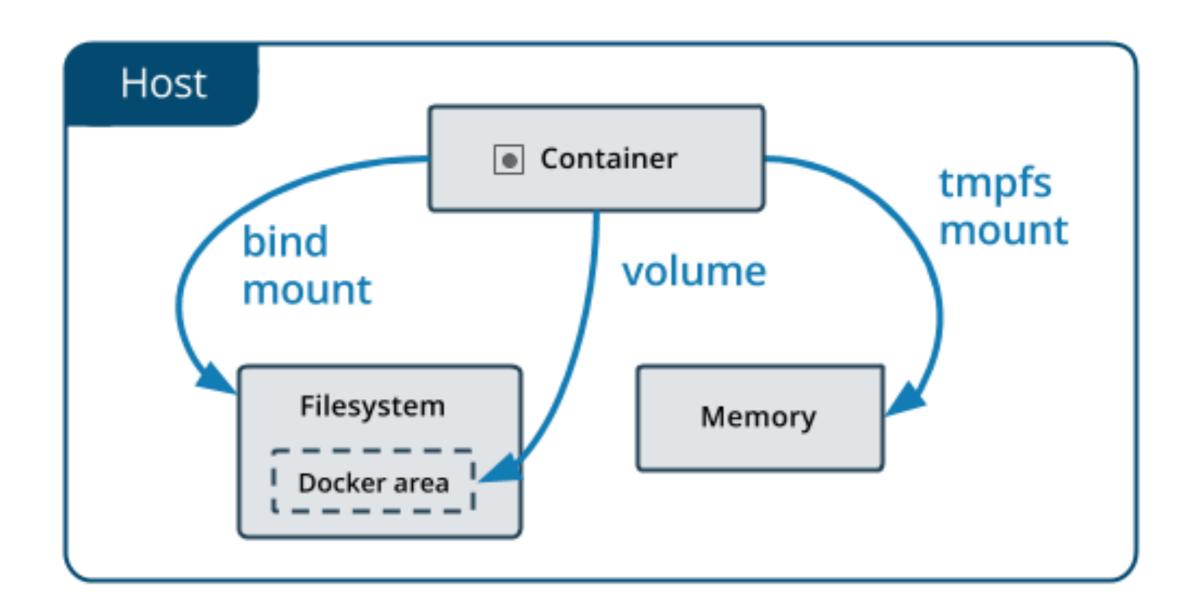

#### Tutorial 4: Lifetimes

- While other container is running, new terminal:
- docker exec -it container number bash
- Run a new command in a running container

#### Data Storage

- By default container is isolated from your disk
- Can ad-hoc copy things from containers
- Three Options for more automatic solutions
  - Temporary storage "tmpfs"
  - Docker-managed storage "volumes"
  - Mounted host directories "bind mounts"

#### **Tutorial 5: Data**

- docker run -it --rm my-jupyter bash
- ipython

```
import numpy as np
x=np.random.randn(1000)
np.savetxt("data.txt", x)
```

 Task: figure out how to use the docker cp command to get data.txt out

## Tutorial 5: Data Bind mounts

- Make a new directory you want to share:
- mkdir ./data
- docker run -it --rm -v \$PWD/data:/data
  my-jupyter bash
- /data now mounted inside image
- Can use this in clever ways!

## Tutorial 5: Data Bind mounts

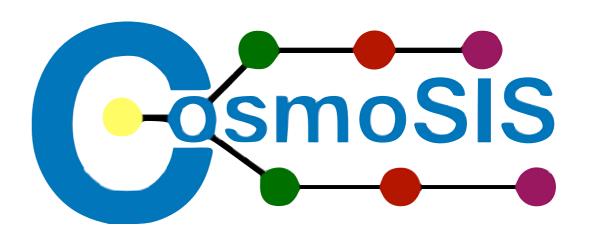

- docker run -it --rm -v \$PWD/data:/data
  my-jupyter bash
- Full path is always required for both elements.
- Can have multiple -v commands for more mounts

#### Science Use Cases

- Distributing complex programs & frameworks
  - e.g. large project analysis suites
- Versioning analysis pipelines
- Running Databases
- Continuous Integration
- Cloud computing?

#### Case Study:

- CosmoSIS project cosmological parameter estimation
- Many dependencies, multi-language architecture
  - GCC, GSL, CFITSIO, FFTW, Lapack, Git, Python 2.7, Numpy, Scipy, Nose, PyYaml, Matplotlib, Emcee
- Large majority of issues associated with installation
  - Consistency very hard to maintain for manual installs

# Case Study: Issues Page

#254: Make fails	installation
#251: Installation error on Ubuntu 16.04	installation
#250: Error with Sierra installation using the bootstrap ups branch	installation
#249: Compilation error related to multinest & libgfortran	installation
#248: make fails on first installation	installation
#247: problems with manual install	installation
#242: Installation error in docker method: outdated pip?	installation
#234: Error with manual installation	installation
#217: Installation fail due to python 3.5 being installed	installation
#208: unable to run cosmosis example/example_a.ini on docker	installation
#207: Installation error OSX 10.9.3 : ImportError: No module named urllib3	installation
#200: el Capitan woes (linking libraries and seg fault)	installation
#194: About the setup script_setup-my-cosmosis	installation
#193: `GFORTRAN_1.4' not found	installation
#183: Unable to run make in RedHat 6 (initial buildup)	installation
#179: Cannot install matplotlib	installation
#177: Can't compile cosmosis	installation
#167: compiling error /usr/bin/ld: cannot find -lblas	installation
#166: Seg fault when running demo 16	installation
#161: Installation failing - URL for package no longer works	installation

#### Case Study: Requirements

- Users will modify code
- Users are busy and unused to docker
- Need to use host machine programs to edit code and view results
- Program are CPU-intensive but I/O-light
- Some components (e.g. Lapack) sensitive to CPU architectures

#### Case Study: Docker Approach

- Build Docker image packaging most dependencies
- Distribute Dockerfile to compile CPU-sensitive components locally
  - Builds upon global image we distribute
  - Users can add their own pieces easily
- Mount code directories from host machine
  - Can be edited from host
  - Outputs saved directly to host machine
- Provide simple scripts to build and launch

#### Case Study: User Interface

Reduced many hours of from-scratch user installation to two commands:

```
./get-cosmosis-and-vm ./cosmosis
./start-cosmosis-vm ./cosmosis
```

Does not affect any other installation method

#### Communication

- By default containers can connect out to world, access internet etc.
  - But outside cannot connect inwards.
- Must expose ports with -p flag if want to connect inwards
  - e.g. to run databases, servers, notebooks

### Tutorial 6: Jupyter

- docker run --rm -it -p 8888 my-juypter jupyter notebook --port=8888 --ip=0.0.0.0 --allow-root
- Open the URL in your browser need to change 0.0.0.0 to 127.0.0.1
- Task: Combine these commands with the data mounting we looked at earlier to save notebook and results to host disk.

#### Tutorial 6: Jupyter

- docker run --rm -it -p 8888 my-juypter jupyter notebook --port=8888 --ip=0.0.0.0 --allow-root
- Green italics = command run inside container
  - Could have just put "bash" then typed all this

#### Docker for HPC

- Pure docker generally unsuitable for HPC
  - Requires root
- Other solutions being developed in HPC sector
  - Singularity (LBL)
  - Shifter (NERSC)
- A little immature but moving fairly quickly

#### Singularity

- Lawrence Berkeley Lab container implementation
- No isolation from old file system
- Can build new images (with root access)
- Runs existing docker images (without root)
- Moderately well developed

#### Shifter

- NERSC container implementation
- No isolation from old file system
- Environment passed through
- Cannot build new images, just run existing ones
- Runs docker images
- Works but no clear error messages yet

## Tutorial 7: More Dockerfile Directives

- CMD
- ENV
- COPY
- USER
- Task: Investigate these directives in the Dockerfile documentation
- Task: Use the CMD directive to make the running your notebook easier

#### Image Management

- Reason Docker is popular: hub.docker.com
- "pull" command goes there and finds image layers
- One private image by default
  - Pay for more and other services

## Tutorial 8: Docker Hub

- Make an account at <u>hub.docker.com</u>
- docker build -t username/my-jupyter .
- docker push username/my-jupyter
- Pull your neighbour's image

#### Tutorial 9: Exploring Images

- Save your image to disk: docker save -o my-jupyter.tar my-jupyter
- Extract the tar file:
   tar -xf my-jupyter.tar
- Have a look around
- These layers are read-only but can be built on
  - Union File System
