Mac & Windows

- Docker "really" only runs under Linux
- On Mac & Windows tiny linux layer run as VM
- No CPU performance impact
- Sometimes disk I/O impact

 Issues with permissions means it actually works better on a mac than linux

Tutorial 2: Running

- docker run --rm -it ubuntu bash
- Run some commands and explore the system, create some files, download some packages, etc.
- In another tab: docker ps
- exit when complete
- docker images
