Tutorial 5: Data
Bind mounts

- **`docker run -it --rm -v $PWD/data:/data my-jupyter bash`**

- Full path is always required for both elements.

- Can have multiple -v commands for more mounts

Tutorial 6: Jupyter

- `docker run --rm -it -p 8888 my-juypter jupyter notebook --port=8888  --ip=0.0.0.0 --allow-root`

- Open the URL in your browser - need to change 0.0.0.0 t0 127.0.0.1

- Task: Combine these commands with the data mounting we looked at earlier to save notebook and results to host disk.
